

Optional combinations for IKON knob cylinders

At the centre of IKON security: Premium quality locking cylinders to cover any eventuality.

Knob cylinders are typically installed in meeting room doors, hotel bedroom doors, residential care home doors and apartment entrance doors in conjunction with mortise locks and door furniture prepared for profile cylinders. The internal knob is used to lock the door, making a key unnecessary on the inside. The IKON product range encompasses various knob designs from knurl knob to knobs with recessed grip. Knob cylinders are easy to operate by young and old alike.

IKON knob cylinders can be manufactured in different lengths according to individual requirement and can thus be adapted to any site condition. There are different optional extras to choose from, such as optional drilling protection or extraction protection for example.

IKON offers a versatile range of possible applications of knob cylinders combined with other IKON products. Outlined below is a small selection:

**Suitable
